a readable yet rigorous approach to an essential part of mathematical thinking back by popular demand real analysis and foundations third edition bridges the gap between classic theoretical texts and less rigorous ones providing a smooth transition from logic and proofs to real analysis along with the basic material the text covers riemann stieltjes integrals fourier analysis metric spaces and applications and differential equations new to the third edition offering a more streamlined presentation this edition moves elementary number systems and set theory and logic to appendices and removes the material on wavelet theory measure theory differential forms and the method of characteristics it also adds a chapter on normed linear spaces and includes more examples and varying levels of exercises extensive examples and thorough explanations cultivate an in depth understanding this best selling book continues to give students a solid foundation in mathematical analysis and its applications it prepares them for further exploration of measure theory functional analysis harmonic analysis and beyond

this edition is a modification for my second edition of real analysis step by step approach which was published on the spring of 2011 the book is designed for students who have completed the ordinary course in elementary calculus and discrete mathematics and it covers a portion of the materials that every student in mathematics is familiar with i hope that this book can enable the student to learn enough examples theorems and methods in analysis

this is part one of a two volume book on real analysis and is intended for senior undergraduate students of mathematics who have already been exposed to calculus the emphasis is on rigour and foundations of analysis beginning with the construction of the number systems and set theory the book discusses the basics of analysis limits series continuity differentiation riemann integration through to power series several variable calculus and fourier analysis and then finally the lebesgue integral these are almost entirely set in the concrete setting of the real line and euclidean spaces although there is some material on abstract metric and topological spaces the book also has appendices on mathematical logic and the decimal system the entire text omitting some less central topics can be taught in two quarters of 25 30 lectures each the course material is deeply intertwined with the exercises as it is intended that the student actively learn the material and practice thinking and writing rigorously by proving several of the key results in the theory
